

OAI 25 08/01/17 Enrollees Release Comments

Variable	Label	Comment	SAS Code
P02HISP	Hispanic or Latino, self-reported	Data change alert for 0.2.1: This variable was not released in version 0.1.1 because Hispanics were too infrequent in the first half of the cohort, and so the variable was considered potentially identifying. As of release 0.2.1 (full cohort), the frequency is high enough and HISP is released.	
P02RACE	Racial background, self-reported (calc)	Data change alert for 0.2.1: As of release 0.2.1, this variable is assigned to the Enrollees dataset. It was previously assigned to the SubjChar dataset. In addition, to preserve anonymity, Asians were grouped into a non-specific "other" category (RACE=7) in release 0.1.1. As of release 0.2.1, enough Asians are included to safely include a separate category for them (RACE=3). Thus, some people have changed from RACE=7 to RACE=3 as of release 0.2.1.	RACE.sas
P02SEX	Gender, male or female	Data change alert for 0.2.1: As of release 0.2.1, this variable is assigned to the Enrollees dataset. It was previously assigned to the SubjChar dataset.	
V00CHRTFL	Participant in first half of cohort, or second half of cohort (calc)	A participant is in the first half of the cohort if they were enrolled before 4/30/05. In addition, any participants whose images were released in the first image set (V00IMAGESA=3) are also included in the "first half," even if they were enrolled a little later. Five participants enrolled before 4/30/05 whose enrollment status was confirmed very late are considered to be in the second half for data release.	

OAI 25 08/01/17 Enrollees Release Comments

Variable	Label	Comment	SAS Code
V00COHORT	Subcohort assignment (calc)	Data change alert for 0.2.1: As of release 0.2.1, this variable is assigned to the Enrollees dataset. It was previously assigned to the SubjChar dataset. Cohort description: The study defines 3 cohorts based on physical characteristics and reported disability. The COHORT values are: 1 = Progression - -at least one knee has symptomatic tibiofemoral knee OA defined as osteophytes OAI grade 2 AND in the same knee frequent symptoms (pain, aching or stiffness on most days for at least one month in the past year). 2 = Incidence - -No symptomatic knee OA in either knee and meets risk factor criteria for their age group. 3 = Non-exposed controls - -No knee pain, aching or stiffness in past 12 months in either knee, no medication for knee pain in past 12 months, tibiofemoral osteophytes AND joint space narrowing grade 0 in both knees, and no risk factors. The risk factors required for study entry are age-specific and assessed by a series of questions during the initial eligibility interview. A more complete description is available in the study protocol or by reviewing the initial eligibility interview annotated form. Occasionally, exceptions to the cohort assignment are made. These are very few and generally only for participants who would otherwise not be eligible for the study.	

OAI 25 08/01/17 Enrollees Release Comments

Variable	Label	Comment	SAS Code
V00IMAGESA	Participant in Image Group A (calc)	Data change alert for 0.2.2, 1.2.1, and 3.2.1: These variables have been expanded from 0/1 indicator variables to multi-level indicator variables that allow investigators to quickly ascertain which participants have the image types (knee MR and/or knee x-ray) at a particular visit. See discussion below for further detail. OAI imaging is not always released concurrently with the corresponding clinical form data because image processing is often not complete by the time clinical form data are ready to release. Each separate release of a set (or batch) of images is identified by a letter (A, B, etc AA, AB, etc. if necessary) defining a sample of participants with images in that set. Separate indicator variables exist in the Enrollees dataset for each visit for which images for that sample have been released. In general, these indicator variables are named VyyIMAGESx, where x is the image sample and Vyy indicates the visit. Thus Image Sample B, which contains 160 participants with released baseline and 12-month images that were released as an early sub-sample, has two corresponding indicator variables, V00IMAGESB and V01IMAGESB. If images have been released for participants in the sample at other visits, additional indicator variables may exist. In the case of IMAGESB, V03IMAGESB serves as an indicator variable for the sample at the 24-month follow-up visit. The possible values for these indicator variables will be 1 for a participant who is a member of the sample had that visit, and had knee MRI only (no knee x-ray). The value will be 2 for a participant who is a member of the sample, had the visit and had knee x-ray only (no knee MRI). The value will be 3 for sample members who had both knee MRI and knee x-ray. SAS special missing values indicate when a participant is a member of the sample, but images for that visit are missing due to the participant's having missed the visit altogether (.V) or having refused all imaging for that visit (.R). Not all values listed above are expected for certain indicator variables. For example, V00IMAGESB and V01IMAGESB can only have a value of 0 or 3, as the participants were chosen based on their having both had both knee MRI and knee x-ray at baseline and 12 months. However, V03IMAGESB can have any of the possible values listed above as the selection criteria for this sample did not include whether or not the participant had images at the 24-month follow-up visit. A participant who is not part of that sample (e.g., a participant in the second half of the cohort in the case of Image Sample C) can only have a value of 0, regardless of what type(s) of imaging they had or whether they missed the visit. The image samples are not mutually exclusive in all cases. For instance, all participants who are in Image Sample A or B are also in Image Sample C. Many are also in Image Sample D.	
V00IMAGESB	Participant in Image Group B (calc)	See comment for variable V00IMAGESA ("Data change alert for 0...")

V00SITE	Clinical center indicator	See comment for variable P02SEX ("Data change alert for 0...")	
V01HADINTV	Indicator variable for having had an interim 6-month visit (18- or 30-month visit) (calc)	As of release 0.2.1, 30-month visits were not complete, so V01HADINTV took the value 2 (had 30-month interim visit) less often and the value 0 (did not have an interim visit) more often than will be the final count. The frequency of V01HADINTV=1 (had 18-month interim visit) is final at 288. As of release 4.2.1 (release of all 30-month data), the frequency of V01HADINTV=2 (had 30-month interim visit) is also final at 494. Of further note: one participant at 18 months and eleven at 30 months had the interview, medication assessment and biospecimen collection, but for various reasons did not have an MRI. The participants are counted as V01HADINTV=1 (for the 18-month) or 2 (for the 30-month), because their interim-visit biospecimens may be useful for some analyses.
